

METHOD OF TREATMENT

FIELD OF THE INVENTION

The present invention relates to methods for treating parasitic diseases using 4-
5 amino-azepan-3-one protease inhibitors. In particular, the present methods serve to inhibit
cysteine proteases of the papain superfamily. Thus, the present invention is useful for
treating parasitic diseases which are mediated by the activity of such proteases. In
particular, the present invention relates to treating malaria by inhibiting falcipain.

10 BACKGROUND OF THE INVENTION

Infection with *Plasmodium falciparum*, the most virulent human malaria pathogen, infects over 280 million people and is estimated to be responsible for over 1 million deaths annually (Gibbons, A. *Science* 1992, 256, 1135; Walsh, J. A. *Ann. N. Y. Acad. Sci.* 1989, 569, 1135). The *Plasmodium falciparum* parasite has a 48 hour life cycle within host 15 erythrocytes that is responsible for all of the clinical manifestations of falciparum malaria. During this cycle, the erythrocyte is invaded by a merozoite, then the intracellular parasite develops from a ring stage into a more metabolically active trophozoite, divides asexually and becomes a schizont, and finally ruptures the host erythrocyte, releasing daughter merozoites that invade other erythrocytes to reinitiate the cycle. During the trophozoite 20 stage, hemoglobin from the host erythrocyte is degraded for use as the parasites principal source of amino acids.

Rosenthal and coworkers have identified a 28 kD trophozoite cysteine protease (TCP or falcipain) from malaria parasites that mediates host hemoglobin degradation (Rosenthal, P. J.; McKerrow, J. H.; Aikawa, M.; Nagasawa, H.; Leech, J. H. *J. Clin. Invest.* 1988, 82, 1560) and is expressed only at the trophozoite stage (Rosenthal, P. J.; Kim, J. H.; McKerrow, J. H.; Leech, J. H. *J. Exp. Med.* 1987, 166, 816). Inhibition of this enzyme 25 results in a blocking of hemoglobin degradation and killing of cultured parasites (Rosenthal, P. J.; Wollish, W. S.; Palmer, J. T.; Rasnick, D. *J. Clin. Invest.* 1991, 88, 1467; Li, R.; Kenyon, G. L.; Cohen, F. E.; Chen, X.; Gong, B.; Dominguez, J. N.; Davidson, E.; 30 Kurzban, G.; Miller, R. E.; Nuzum, E. O.; Rosenthal, P. J.; McKerrow, J. H. *J. Med. Chem.* 1995, 38, 5031). In a mouse model of infection with *P. vinckei*, the analogous murine malarial parasite, treatment with cysteine protease inhibitors resulted in a long-term 35 curative effect (>75 days) in 80% of animals (Rosenthal, P. J.; Lee, G. K.; Smith R. E. J.

Clin. Invest. 1993, 91, 1052). Thus, a selective inhibitor of falcipain may be an effective anti-malarial therapy either in conjunction with or as a replacement for the quinoline-derived drugs.

In addition to *Plasmodium falciparum*, other parasites utilize cysteine proteases in their life cycle. These include *Trypanosoma cruzi*, *Trypanosoma Brucei* [trypanosomiasis (African sleeping sickness, Chagas disease)], *Leishmania mexicana*, *Leishmania pifanoi*, *Leishmania major* (leishmaniasis), *Schistosoma mansoni* (schistosomiasis), *Onchocerca volvulus* [onchocerciasis (river blindness)] *Brugia pahangi*, *Entamoeba histolytica*, *Giardia lamblia*, the helminths, *Haemonchus contortus* and *Fasciola hepatica*, as well as helminths of the genera *Spirometra*, *Trichinella*, *Necator* and *Ascaris*, and protozoa of the genera *Cryptosporidium*, *Eimeria*, *Toxoplasma* and *Naegleria* (McKerrow, J. H. (1995) in *Perspect. Drug Dis. Des.* 2, eds., Craik, C. S., Debouck, C., pp. 437-444; Robertson, C. D., Coombs, G. H., North, M. J., Mottram, J. C. (1996) in *Perspect. Drug Dis. Des.* 6, eds., McKerrow, J. H. and James, M. N. G., pp. 99-118).

It has now been discovered that certain 4-amino-azepan-3-ones are protease inhibitors, most particularly inhibitors of falcipain, and that these compounds are useful for treating parasitic diseases, particularly malaria.

Summary of the Invention

An object of the present invention is to provide methods of treatment which serve to inhibit cysteine proteases, and particularly cysteine proteases of the papain superfamily. The present methods are useful for treating parasitic diseases which may be therapeutically modified by altering the activity of such proteases. In particular, the present invention relates to treating malaria by inhibiting falcipain.

Accordingly, in the first aspect, this invention provides a method of treating parasitic diseases in which the disease pathology may be therapeutically modified by inhibiting proteases, such as cysteine proteases, using 4-amino-azepan-3-ones of Formula I. In particular, these compounds are used in the present method to treat parasitic diseases by inhibiting cysteine proteases of the papain superfamily. Most particularly, the present invention provides a method of treating malaria by the inhibition of falcipain with such compounds.

Detailed Description of the Invention

15 Specific representative compounds which are useful in the present methods are set forth in Examples 1-222.

The present invention includes deuterated analogs of the inventive compounds. A representative synthetic route for the deuterated compounds of the present invention is set forth in Scheme 7, below. The deuterated compounds of the present invention exhibit 20 superior chiral stability compared to the protonated isomer.

Definitions

The compounds used in the present invention includes all hydrates, solvates, complexes and prodrugs of the compounds of this invention. Prodrugs are any covalently bonded compounds which release the active parent drug according to Formula I *in vivo*. If a chiral center or another form of an isomeric center is present in a compound of the present invention, all forms of such isomer or isomers, including enantiomers and diastereomers, are intended to be covered herein. Compounds containing a chiral center may be used as a racemic mixture, an enantiomerically enriched mixture, or the racemic mixture may be 25 separated using well-known techniques and an individual enantiomer may be used alone. In cases in which compounds have unsaturated carbon-carbon double bonds, both the cis (Z) and trans (E) isomers are within the scope of this invention. In cases wherein 30 compounds may exist in tautomeric forms, such as keto-enol tautomers, each tautomeric

form is contemplated as being included within this invention whether existing in equilibrium or predominantly in one form.

The meaning of any substituent at any one occurrence in Formula I or any subformula thereof is independent of its meaning, or any other substituent's meaning, at any other occurrence, unless specified otherwise.

Abbreviations and symbols commonly used in the peptide and chemical arts are used herein to describe the compounds of the present invention. In general, the amino acid abbreviations follow the IUPAC-IUB Joint Commission on Biochemical Nomenclature as described in *Eur. J. Biochem.*, 158, 9 (1984).

"Proteases" are enzymes that catalyze the cleavage of amide bonds of peptides and proteins by nucleophilic substitution at the amide bond, ultimately resulting in hydrolysis. Such proteases include: cysteine proteases, serine proteases, aspartic proteases, and metalloproteases. The compounds of the present invention are capable of binding more strongly to the enzyme than the substrate and in general are not subject to cleavage after enzyme catalyzed attack by the nucleophile. They therefore competitively prevent proteases from recognizing and hydrolyzing natural substrates and thereby act as inhibitors.

The term "amino acid" as used herein refers to the D- or L- isomers of alanine, arginine, asparagine, aspartic acid, cysteine, glutamine, glutamic acid, glycine, histidine, isoleucine, leucine, lysine, methionine, phenylalanine, proline, serine, threonine, tryptophan, tyrosine and valine.

"C₁-6alkyl" as applied herein is meant to include substituted and unsubstituted methyl, ethyl, n-propyl, isopropyl, n-butyl, isobutyl and t-butyl, pentyl, n-pentyl, isopentyl, neopentyl and hexyl and the simple aliphatic isomers thereof. C₁-6alkyl may be optionally substituted by a moiety selected from the group consisting of: OR¹⁴, C(O)R¹⁴, SR¹⁴, S(O)R¹⁴, NR¹⁴₂, R¹⁴NC(O)OR⁵, CO₂R¹⁴, CO₂NR¹⁴₂, N(C=NH)NH₂, Het, C₃-6cycloalkyl, and Ar; where R⁵ is selected from the group consisting of: H, C₁-6alkyl, C₂-6alkenyl, C₂-6alkynyl, C₃-6cycloalkyl-C₀-6alkyl, Ar-C₀-6alkyl and Het-C₀-6alkyl; and R¹⁴ is selected from the group consisting of: H, C₁-6alkyl, Ar-C₀-6alkyl, and Het-C₀-6alkyl;

"C₃-6cycloalkyl" as applied herein is meant to include substituted and unsubstituted cyclopropane, cyclobutane, cyclopentane and cyclohexane.

"C₂-6 alkenyl" as applied herein means an alkyl group of 2 to 6 carbons wherein a carbon-carbon single bond is replaced by a carbon-carbon double bond. C₂-6alkenyl

includes ethylene, 1-propene, 2-propene, 1-butene, 2-butene, isobutene and the several isomeric pentenes and hexenes. Both cis and trans isomers are included.

"C₂-6alkynyl" means an alkyl group of 2 to 6 carbons wherein one carbon-carbon single bond is replaced by a carbon-carbon triple bond. C₂-6 alkynyl includes acetylene, 1-

5 propyne, 2-propyne, 1-butyne, 2-butyne, 3-butyne and the simple isomers of pentyne and hexyne.

"Halogen" means F, Cl, Br, and I.

2-Methyl-pent-4-enoic acid ethyl ester is converted to a N-2-pyridinesulfonyl-azapine by reduction to the aldehyde, reductive amination with allylamine, sulfonylation with 2-pyridyl sulfonyl chloride, and olefin metathesis with Grubbs' catalyst. Epoxidation with mCPBA affords a mixture of epoxides that are separable by column chromatography.

5-Hexen-2-one is converted to a N-carbobenzyloxy-azapine by reductive amination with allylamine, protection with carbobenzyloxychloride, and olefin metathesis with

5 Grubbs' catalyst. Epoxidation with mCPBA affords a mixture of epoxides that are separable by column chromatography. Each epoxide is converted into an amino alcohol by opening with sodium azide followed by reduction with triphenylphosphine. Acylation of the free amine with Boc-leucine and a coupling reagent such as HBTU or EDC, followed by deprotection of the Cbz group by hydrogenolysis provides the secondary amines which are 10 in turn sulfonated with 2-pyridine sulfonylchloride. Deprotection of the Boc groups with HCl and acylation with a variety of aromatic carboxylic acids and coupling reagents such as HBTU or EDC gives the intermediate alcohols. Final oxidation with Dess-Martin periodinane and HPLC affords the desired ketones.

5 reacted with allyl Grignard with a copper (I) catalyst or a similar allyl organometallic reagent. The amine is then alkylated with allyl iodide. Grubbs' catalyst is then used to form the azapine ring by ring closing metathesis. Epoxidation of the alkene followed by separation of the diastereomers followed by opening of the epoxide of the minor component with sodium azide provides the intermediate azido alcohol. Reduction of the azide 10 followed by acylation of the amine with Boc-leucine followed by deprotection of the Cbz gives the intermediate secondary amine, which is then sulfonylated with an sulfonyl chloride. Utility of the Invention

10 In general, the present invention provides a method of inhibiting cysteine proteases of the papain superfamily by administering to a patient in need thereof, particularly an animal, more particularly a mammal, most particularly a human being, one or more of the compounds of Formula I.

15 The present invention also provides a method of treating a parasitic disease mediated by a cysteine protease by administering to a patient in need thereof, particularly an animal, more particularly a mammal, most particularly a human being, one or more of the compounds of Formula I.

20 Parasites known to utilize cysteine proteases in their life cycle include *Plasmodium falciparum* (malaria), *Trypanosoma cruzi*, *Trypanosoma Brucei* [trypanosomiasis (African sleeping sickness, Chagas disease)], *Leishmania mexicana*, *Leishmania pifanoi*, *Leishmania major* (leishmaniasis), *Schistosoma mansoni* (schistosomiasis), *Onchocerca volvulus* [onchocerciasis (river blindness)] *Brugia pahangi*, *Entamoeba histolytica*, *Giardia lamblia*, the helminths, *Haemonchus contortus* and *Fasciola hepatica*, as well as helminths of the genera *Spirometra*, *Trichinella*, *Necator* and *Ascaris*, and protozoa of the genera *Cryptosporidium*, *Eimeria*, *Toxoplasma* and *Naegleria*. The present method provides treatment of diseases caused by infection by these parasites by inhibiting cysteine proteases of the papain superfamily by administering to a patient in need thereof, particularly an animal, more particularly a mammal, most particularly a human being, one or more of the compounds of Formula I.

As demonstrated in Table 1 below, the compounds of Formula I used in the inventive method are especially effective in inhibition of one or more of the following parasitic proteases: falcipain (*P. falciparum*), cruzain (*T. cruzi*), rhodazain (*T. brucei rhodesiensis*), leishmania L (*Leishmania spp.*), leishmania B (*Leishmania spp.*), and schistosoma B (*S. mansoni*).

More particularly, the present invention provides a method of treating diseases selected from a group consisting of: malaria, trypanosomiasis (African sleeping sickness, Chagas disease), leishmaniasis, schistosomiasis, onchocerciasis (river blindness) and giardiasis by administering to a patient in need thereof, particularly an animal, more particularly a mammal, most particularly a human being, one or more of the compounds of Formula I.

Most particularly, the present invention provides a method of treating malaria, caused by infection with *Plasmodium falciparum*, by the inhibition of falcipain by administering to a patient in need thereof, particularly an animal, more particularly a mammal, most particularly a human being, one or more of the above-listed compounds.

The present method may be practiced by administering the above-listed compounds alone or in combination with other therapeutically effective compounds, including but not limited to quinoline-derived drugs.

Certain radical groups are abbreviated herein. t-Bu refers to the tertiary butyl radical, Boc refers to the t-butyloxycarbonyl radical, Fmoc refers to the fluorenylmethoxycarbonyl radical, Ph refers to the phenyl radical, Cbz refers to the benzyloxycarbonyl radical.

The present invention includes all esters, hydrates, solvates, complexes and prodrugs of the above-listed compounds useful in the inventive method. Prodrugs are any covalently bonded compounds which release the active parent drug *in vivo*. If a chiral center or another form of an isomeric center is present in a compound of the present invention, all forms of such isomer or isomers, including enantiomers and diastereomers, are intended to be covered herein. Inventive compounds containing a chiral center may be used as a racemic mixture, an enantiomerically enriched mixture, or the racemic mixture may be separated using well-known techniques and an individual enantiomer may be used alone. In cases in which compounds have unsaturated carbon-carbon double bonds, both the cis (Z) and trans (E) isomers are within the scope of this invention. In cases wherein compounds may exist in tautomeric forms, such as keto-enol tautomers, each tautomeric

form is contemplated as being included within this invention whether existing in equilibrium or predominantly in one form.

The methods of treatment of this invention also use pharmaceutical compositions which comprise one or more of compounds of Formula I and a pharmaceutically acceptable carrier, diluent or excipient. Accordingly, the compounds of Formula I may be used in the manufacture of a medicament useful in the practice of the present methods of treatment. Pharmaceutical compositions of compounds of Formula I prepared as hereinbefore described may be formulated as solutions or lyophilized powders for parenteral administration. Powders may be reconstituted by addition of a suitable diluent or other pharmaceutically acceptable carrier prior to use. The liquid formulation may be a buffered, isotonic, aqueous solution. Examples of suitable diluents are normal isotonic saline solution, standard 5% dextrose in water, or buffered sodium or ammonium acetate solution. Such formulation is especially suitable for parenteral administration, but may also be used for oral administration or contained in a metered dose inhaler or nebulizer for insufflation. It may be desirable to add excipients such as polyvinylpyrrolidone, gelatin, hydroxy cellulose, acacia, polyethylene glycol, mannitol, sodium chloride, or sodium citrate.

Alternately, these compounds may be encapsulated, tableted, or prepared in an emulsion or syrup for oral administration. Pharmaceutically acceptable solid or liquid carriers may be added to enhance or stabilize the composition, or to facilitate preparation of the composition. Solid carriers include starch, lactose, calcium sulfate dihydrate, terra alba, magnesium stearate or stearic acid, talc, pectin, acacia, agar or gelatin. Liquid carriers include syrup, peanut oil, olive oil, saline and water. The carrier may also include a sustained release material such as glyceryl monostearate or glyceryl distearate, alone or with a wax. The amount of solid carrier varies but, preferably, will be between about 20 mg to about 1 g per dosage unit. The pharmaceutical preparations are made following the conventional techniques of pharmacy involving milling, mixing, granulating, and compressing, when necessary, for tablet forms; or milling, mixing and filling for hard gelatin capsule forms. When a liquid carrier is used, the preparation will be in the form of a syrup, elixir, emulsion or an aqueous or non-aqueous suspension. Such a liquid formulation may be administered directly or filled into a soft gelatin capsule.

For rectal administration, the compounds of Formula I may also be combined with excipients such as cocoa butter, glycerin, gelatin or polyethylene glycols and molded into a suppository.

In accordance with this invention, an effective amount of one or more compounds of Formula I is administered to inhibit the protease implicated with a particular condition or disease. Of course, this dosage amount will further be modified according to the type of administration of the compound. For example, for acute therapy, parenteral administration of an effective amount of a compound of Formula I is preferred. An intravenous infusion of the compound in 5% dextrose in water or normal saline, or a similar formulation with suitable excipients, is most effective, although an intramuscular bolus injection is also useful. Typically, the parenteral dose will be about 0.01 to about 100 mg/kg; preferably between 0.1 and 20 mg/kg, in a manner to maintain the concentration of drug in the plasma at a concentration effective to inhibit the parasitic protease, e.g. falcipain in the case of treatment of malaria. The compounds are administered one to four times daily at a level to achieve a total daily dose of about 0.4 to about 400 mg/kg/day. The precise amount of an inventive compound which is therapeutically effective, and the route by which such compound is best administered, is readily determined by one of ordinary skill in the art by comparing the blood level of the agent to the concentration required to have a therapeutic effect.

The compound may be administered in the form of a prodrug which, in general, is designed to enhance absorption and is cleaved in vivo to form the active component. Efficacious levels may also be achieved by administration of pharmaceutically active metabolites or bioisosteres of the compound. Prodrugs of compounds of the present invention may be prepared by any suitable method.

The compounds used in this method may also be administered orally to the patient, in a manner such that the concentration of drug is sufficient to inhibit cysteine proteases, e.g. falcipain in the case of treatment of malaria, or to achieve any other therapeutic indication as disclosed herein. Typically, a pharmaceutical composition containing the compound is administered at an oral dose of between about 0.1 to about 50 mg/kg in a manner consistent with the condition of the patient. Preferably the oral dose would be about 0.1 to about 50 mg/kg given 1-2 times/day.

No unacceptable toxicological effects are expected when compounds of the present invention are administered in accordance with the present method of treatment.

Biological Assays

5 The compounds used in the present method may be tested in one of several biological assays to determine the concentration of a compound which is required to have a given pharmacological effect. For example, an assay for determining parasitic cysteine protease catalytic activity and an assay to determine the amount of cysteine protease inhibition by a compound of the inventive method are provided.

10

Determination of cysteine protease catalytic activity

Standard assay conditions for the determination of kinetic constants used 10 uM fluorogenic peptide substrate, Cbz-Phe-Arg-AMC for the cysteine proteases from *Leishmania spp* and *Schistosoma Mansoni*, Cbz-Leu-Arg-AMC for the cysteine proteases from *Plasmodium falciparum* and *Trypanosoma brucei rhodesiensis*, and Ac-Lys-Glu-Lys-Leu-Arg-AMC (4 uM final substrate concentration) for the cysteine protease from *Trypanosoma cruzi*, and were determined in 100 mM Na acetate at pH 5.5 containing 5 mM cysteine. Stock substrate solutions were prepared at concentrations of 10 mM in DMSO with 10 uM (4 uM for Ac-Lys-Glu-Lys-Leu-Arg-AMC) final substrate concentration in the assays. The final DMSO concentration was 2 % and the final volume was 100 uL. All assays were conducted at ambient temperature. Product progress curves were generated over 20 to 30 minutes following formation of AMC product.

Inhibition studies

25 Potential inhibitors were evaluated using the progress curve method. Assays were carried out in the presence of variable concentrations of test compound. Reactions were initiated by addition of enzyme to buffered solutions of inhibitor and substrate. Data analysis was conducted according to one of two procedures depending on the appearance of the progress curves in the presence of inhibitors. For those compounds whose progress 30 curves were linear, apparent inhibition constants ($K_{i,app}$) were calculated according to equation 1 (Brandt *et al.*, *Biochemistry*, 1989, 28, 140):

$$v = V_m A / [K_a (1 + I/K_{i,app}) + A] \quad (1)$$

where v is the velocity of the reaction with maximal velocity V_m , A is the concentration of substrate with Michaelis constant of K_m , and I is the concentration of inhibitor.

5 For those compounds whose progress curves showed downward curvature characteristic of time-dependent inhibition, the data from individual sets was analyzed to give k_{obs} according to equation 2:

$$[AMC] = v_{ss} t + (v_0 - v_{ss}) [1 - \exp(-k_{obs} t)] / k_{obs} \quad (2)$$

10 where $[AMC]$ is the concentration of product formed over time t , v_0 is the initial reaction velocity and v_{ss} is the final steady state rate. Values for k_{obs} were then analyzed as a linear function of inhibitor concentration to generate an apparent second order rate constant (k_{obs} / inhibitor concentration or k_{obs} / $[I]$) describing the time-dependent inhibition. A complete discussion of this kinetic treatment has been fully described
 15 (Morrison *et al.*, *Adv. Enzymol. Relat. Areas Mol. Biol.*, **1988**, *61*, 201).

Exemplary inhibition data for the compounds used in the present method collected in accordance with the above-described procedure are listed in Table I.

20 The data in Table I demonstrate that the compounds of the present invention are efficacious inhibitors of the cysteine protease of one or more of the parasites selected from the group consisting of: *Leishmania spp*, *Schistosoma Mansoni*, *Plasmodium falciparum*, *Trypanosoma brucei rhodesiensi*, and *Trypanosoma cruzi*, and thus, if administered according to the present method, may be therapeutically effective in treating malaria and other parasitic diseases identified herein above in animals, particularly mammals, most particularly human beings.

Varian 300 instrument utilizing a Varian UNITYplus300 operating software. Chemical shifts are reported in parts per million (ppm) downfield from tetramethylsilane as the internal standard, and coupling constants are given in Hertz. The following abbreviations are used for spin multiplicity: br = broad, s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet, cm = complex multiplet. Infrared (IR) spectra were recorded on a Perkin-Elmer 1600 series FTIR spectrometer and are reported in wave numbers (cm-1).
